

GUI vs CLI comparison

GUI stands for graphical user interface, it is a visual way to interact with computers using pictures, buttons, folders and menus. It was made with the intention to be user friendly, with simple commands like dragging and dropping, and painting and clicking.

CLI is short for command line interface, where rather than pointing and clicking on folders and pictures, you're only using text commands to navigate your computer. In the terminal you can change file names, create and edit files and so on. The benefit to CLI is that it is very precise and can even be more time efficient than GUI once you learn the commands.
